# Sovereign Risk & European Banks

## Core Banks Oversold

- **Sovereign Risk Worries** – The European banks sector has de-rated c.20% on a Price/Tangible BV basis since the YTD high in February. It is currently trading at its lowest multiple (1.09x P/TBV) since May 2009. Recent developments in Europe's periphery have pitched Germany against the ECB / EU on how to deal with private holders of sovereign debt. Our economists see a high likelihood of debt restructuring with haircuts in Greece, Ireland and Portugal. As a result, risks for banks in "Core" (DE / FR / IT / UK) and "Peripheral" (GR / IR / PT / SP) countries have increased meaningfully.
- **€70bn 'Core Coverage' Losses** – We estimate total losses for the *European Core banks under Citi coverage* to be €69bn in our stress scenario. Of these, €17bn would be from GR / IR / PT and €52bn due to Spain. *For the European Core banking systems*, total losses would be €98bn with €24bn due to the three smaller peripherals and €74bn due to Spain (Figure 2). Losses arise from direct sovereign debt exposures, customer loans exposures and higher funding costs. Greece is not the key issue for the core banking systems. It is contagion to Spain that is of most concern.
- **No Capital Needs for 'Core' Banks** – Under our bottom-up stress test, no bank from the "core countries" needs capital. For the sample of 26 banks, the 2013E Common Equity Tier 1 ratio would decline from an estimated 11% to 9.7%. While no core country bank drops below 7%, three Spanish banks would need to raise a combined €2.1bn.
- **Buy Core Europe** – Core banks appear to be undervalued based on a minimum stressed common equity Tier 1 ratio of 7% under our top-down stress test – by anywhere from c.5% (Italy) to c.16% (France). While Italian, German and UK banks face their own issues, we believe French banks are being unfairly penalised by the markets. G-SIFI requirements and the CRD4/EU Maximum Harmonisation process should allay concerns about French banks' capitalization levels.
- **Top 5 Picks** – We upgrade French banks to Overweight and German banks to Neutral. In our Top 5 picks we replace BNP Paribas for SocGen, which we believe is oversold on the back of sovereign and capital concerns. Our other Top 5 picks include Credit Suisse, DnB NOR, HSBC and Standard Chartered.

# Sovereign Risk & European Banks

The European sovereign crisis is causing another bout of negative sentiment towards bank equity. Greece is in discussions with the IMF and the EU on how to avoid a wholesale restructuring of its debt. Ireland is grappling with a bank crisis which has spread to the Irish sovereign balance sheet. In Portugal, much needed structural reforms will likely take years to make a dent to a growing Debt/GDP ratio. And Spain, which has until now been the most proactive of the peripherals in terms of banking sector reforms, needs to do more to insulate itself from sovereign contagion, in our view.

A number of events take place over the next few months which could act as critical catalysts for the market. At the end of June, or in July, we will see the publication of the European bank stress tests as well as the initial Basel proposals for a capital surcharge on the global systemically important institutions (G-SIFI). Investors will also be watching closely the Bankia IPO process, an important indicator of whether investor confidence in Spain's banking sector has turned in our view. In the same month the IMF will make a decision on whether to disburse the fifth tranche (combined €12bn EU/IMF) of the Greek bailout money. The IMF itself is in the middle of a leadership transition as is the ECB.

So how serious can the latest crisis become? In this report, we argue that potential losses to the 'core' European banking systems of Germany, France, Italy and UK from losses in Portugal, Ireland and Greece are manageable at €24bn on our estimates. However, if contagion spreads to Spain, we estimate losses could be an additional €74bn. As for the peripheral countries themselves (PT / IR / GR / SP), "domestic" losses could total €172bn, of which €92bn is Spain-related.

We believe that the market has turned overly bearish on the banks in the four Core European banking systems. Core banks appear to be undervalued based on a minimum stressed common equity Tier 1 ratio of 7% under our top-down stress test – by anywhere from c.5% (Italy) to c.16% (France). While Italian, German and UK banks face their own sets of issues, we believe that the French banks are being unfairly penalised by the markets. G-SIFI requirements and the CRD4/EU Maximum Harmonisation process should allay concerns about capitalization levels of the French banks.

We upgrade French banks to Overweight and German banks to Neutral. In our Top 5 picks we replace BNP Paribas for SocGen which we believe is oversold on the back of sovereign and capital concerns. Our other Top 5 picks include Credit Suisse, DnB NOR, HSBC and Standard Chartered.

Figure 2. European Banks – Estimated Stress Test Losses from Peripheral Exposures, Top-Down Estimates (€bn)

| System – Losses By Risk Country | Core *    | Periphery * | Rest Europe * |            |
|---------------------------------|-----------|-------------|---------------|------------|

## Peripheral-to-Core Interconnectedness

In addition to fundamentals (Figure 4), we believe the most important factor in determining how contagious a peripheral country could be is to understand the degree of interconnectedness between that country and the wider European banking sector. Exposures generally can be classified as sovereign debt; loans to the private sector (mortgages, corporate loans, etc.); funding to peripheral banks; and derivatives.

Figure 4. Peripheral Countries & Italy – Gvt Debt/GDP, 2010-15E (%) \*

Source: Citi Investment Research and Analysis, IMF (Ireland data)

\* While Italy is not a peripheral country per se, its banks (especially funding costs) are thought to be susceptible to contagion from the peripheral banking systems.

**Europe as defined in BIS data includes:**  
Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom

The Bank for International Settlements (BIS) has started reporting banks' cross-border claims to a number of countries broken down by the type of exposure. We have used the BIS cross-border data in conjunction with peripheral countries' central bank data in order to arrive at a fuller picture of peripheral risk. Figure 6 shows the peripheral exposures as of end-4Q10 for a number of banking systems as % of capital & reserves (ECB and central banks definition). Europe as defined in BIS data includes: Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom.

### 5% of Core Countries' Capital & Reserves Exposed to Greece

**5% of the Core European banks' capital & reserves is exposed to Greece, 16% to Ireland, 4% to Portugal (25% total): and an additional 22% to Spain**

**The four core banking systems (Germany, France, Italy and UK)** have exposures amounting to 5% of their equity to Greece, 16% to Ireland and 4% to Portugal. Spain is an additional 22% with the majority of that exposure being private sector loans made by German and French banks. Therefore the four core European countries' exposure to peripheral risks is c.47% of capital & reserves.

The data clearly shows that Greece in itself does not represent a meaningful risk to the European banking system, in our view. However, contagion spreading to Portugal and Ireland could potentially impact Spain as well. Hence the ECB's valiant efforts to ring-fence Greece.

**For the European (BIS reporting) banks,** approximately 68% of capital & reserves is exposed to Greece, Ireland and Portugal. Spain is even larger, an additional 102% (Figure 6), for a total of 170% exposure.

\* ECB definition of Capital & Reserves. Note on BIS data: German exposure data is on an immediate borrower basis; the rest is on an ultimate risk basis. "Public sector" = sovereign. "Banks" = exposure to funding instruments issued by banks in that country or by of foreign banks subsidiaries in that country. "Non-bank private" = loans to the private sector (mortgages, SME loans, corporate loans). Consolidated bank subsidiaries' exposures in another country are not counted (i.e., no double-counting). Unconsolidated subsidiaries' exposures are classified as "Non-bank private" exposures.

\*\* Core Europe = Germany, France, Italy, UK. Europe as defined in BIS data includes Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom.

The table below shows the total exposure of the ECB to the peripheral countries. In the case of principal losses, the member states of the ECB would have to plug any solvency gap in proportion to their share in the subscription capital of the Bank. Currently, the Eurosystem capital and reserves are €81.5bn which includes ECB's paid-in capital of €5.3bn and ECB's provisions of €5.2bn.

## Bottom-Up Stress: No Capital Needs for Core Country Banks

In anticipation of the European Banking Association's stress tests we conduct our own stress tests (the EBA results are due to be announced at end-June or in July). We stress individual banks along three dimensions: sovereign losses, asset quality and funding costs. Our methodology is described in the following pages.

**Figure 8. Bottom-Up Stress Test – Estimated and Stressed 2013 Core Equity Tier 1 Ratios (Basel 2) (%)**

Source: Company reports, Citi Investment Research and Analysis

For the 26 banks, the core equity Tier 1 ratio (Basel 2) drops from an estimated 11.0% in 2013 to a stressed level of 9.7%

- For the 26 banks whose potential losses we calculate explicitly, the core equity Tier 1 ratio (Basel 2) drops from an estimated 11% in 2013 to a stressed level of 9.7% (Figure 9). Calibrating to a 7% minimum, the capital shortfall is €2bn.

- **No banks from Core countries are affected.** Three Spanish banks would need to raise capital: BBVA (€1bn), Popular (€0.8bn) and Sabadell (€0.3bn). For the **local Spanish**, the capital shortfall is mostly due to higher stressed loan losses. For the international Spanish banks, the driver is Spanish sovereign exposure – especially at BBVA which has higher exposure than Santander.

Under our bottom-up stress test, 26 banks experience after-tax losses of €112bn – with €2bn capital needs

- Under our stress test, the 26 banks experience after-tax losses of €112bn (Figure 10) – with c.15% deriving from peripheral sovereign exposures, c.50% from deteriorating asset quality (in the total book, including non-peripheral loans) and c.35% from higher funding costs.

Source: Company reports, Reuters, CEBS, EBA, ECB, Central banks, BIS, Citi Investment Research and Analysis

\* Credit Agricole has only disclosed Credit Agricole Group sovereign exposures (and not of CASA). Our analysis assumes all sovereign is held as CASA level, which could therefore overstate the estimated impact of restructuring.

\*\* Dexia calculations under Basel 2 do not take into account the negative impact of bank's frozen AFS reserve on its capital position.

These results roughly dovetail with the results of another, top-down, stress test we perform in a later section (Figure 10). Under that test, after-tax losses would amount to €139bn to banks under Citi coverage and €291bn to the whole European banking system (BIS). Total system losses would be nearly evenly split among the three types of peripheral exposure (to total €291bn). The reason loan losses feature more prominently in the bottom-up stress test is because we stress the entire loan book of the 26 banks – and in the top-down stress test we stress only the peripheral loan exposures.

Figure 10. Stress Tests – Comparison Between Results of Bottom-Up and Top-Down Stress Test Results (€bn)

| Type of Loss (after-tax) | Bottom-Up Stress:<br>26 Individual Banks | Top-Down Stress:<br>Citi Banks Coverage | Top-Down Stress:<br>Europe Bank Systems * |

## Bottom-Up Stress Methodology

Our sovereign bond stressed prices are generally in-line with the stress assumptions under EBA's 2011 stress test

To stress for **sovereign risk**, we apply the marks in Figure 12 to the banks' capital & reserves and capital to the exposures in Figure 11. Our stressed bond prices are generally in-line with the stress parameters under EBA's proposed 2011 stress test, which prescribes percentage drops in bond prices. **Our stress assumptions for bond prices in a stress scenario are: 40% for Greece, 61% for Ireland, 67% for Portugal and 82% for Spain.**

**These are by no means the worst-case assumptions, which could well be much greater if contagion spreads to Spain. EBA sovereign stress assumptions may still be considered optimistic by some investors; in no way do we use them to define the upper bound of losses.**

Our methodology is different to EBA's: we stress the ENTIRE sovereign book

Our methodology is different to EBA's. While EBA is likely to only stress the trading sovereign book (fair value through P&L, AFS) of the banks, we also stress the banking sovereign book (AFS, HTM). As a reminder, c.80% of most Developed Europe banks' banking sovereign books are classified as AFS hence negative marks on peripheral sovereign debt should already have been reflected in reported book value numbers (but not in regulatory capital calculations). For Greek banks, 80% of the banking book is HTM after reclassifications back in April/May 2010. In any case, we mark to market the entire book, including HTM, as our underlying assumption is that EBA's stressed values would be reached under a scenario that acts as an "impairment trigger" in accounting terms.

For loan losses, we apply a 100% increase to the currently estimated cumulated cost of risk over 2011-13 for the smaller peripheral banks; 50% for the international peripheral banks; and 25% for everyone else

To stress for **asset quality**, we apply the assumptions in Figure 13 below on a bank-by-bank basis. We apply a 100% increase to the currently estimated cumulated cost of risk over 2011-13 for the smaller peripheral banks; 50% for the international peripheral banks; and 25% for everyone else. In certain cases (Italian banks), stressed cost of risk assumptions are derived bottom-up from the split of the loan book. As a result, the 2011-13 cumulated cost of risk for the 26 banks moves from 212 bps (current estimate) to 292 bps (stressed), an increase of 37%. We believe this is a severe enough assumption, as asset quality has started to improve in most European countries.

Figure 13. Bottom-Up Stress Test – Cost of Risk Assumptions, Cumulated 2011-13 (bps)

| Bank                 | Base       | Stressed   | Chg %      |

We apply a funding stress differentiated by the type of bank

Lastly, we apply a **funding stress** differentiated by the type of bank – by reducing Gross Operating Profit as detailed in Figure 14. We also assume an unchanged dividend policy.

The funding stress in our bottom-up approach may appear to be less onerous than the top-down stress test at first glance (see section *Top-Down: Higher Funding Costs*): with bottom-up losses coming in at €19bn vs. €48bn for Citi's coverage as derived from the top-down test. The reason for this is that we stress the entire EU27 banking system in the latter test and then scale down in size to estimate losses for banks under Citi coverage. The EU27 system includes a number of non-quoted banks, Landesbanken, cajas, Raiffeisenbanken, etc. These would likely experience large % increases in the cost of funding and would likely play an even larger part in a funding-driven delevering of balance sheets.

---

**Figure 14. Bottom-Up Stress Test – Funding Stress-Test Assumption – Decline in Gross Operating Profit by Year and Type of Bank Relative to Current Estimates**

|      | Retail | Universal | Wholesale |
|------|--------|-----------|-----------|

## Top-Down Stress: €70bn 'Core Coverage' Losses

The risk factors surrounding European banks currently include first and foremost losses stemming from the sovereign crisis (sovereign debt losses, losses from deteriorating asset quality in the peripheral countries, and higher funding costs). Additional risk factors include regulatory moves towards higher capital requirements, stricter liquidity and "stable funding" requirements as well as subdued GDP growth resulting in lower than expected volumes. While the additional risk factors are hard to quantify, we believe that sovereign risk is the biggest worry on investors' minds at the moment.

In a stress-test top-down scenario, losses to the Core banks under our coverage could amount to c.€70bn – and €100bn to the banking systems in the Core countries

- Our conclusion is that, in our stress scenario, **the Core banks under our coverage would experience losses of c.€70bn**. We explain our methodology in the following pages.
- For the Core banking systems (Germany, France, Italy, UK), losses could amount to c.€100bn (Figure 15 and Figure 17) – split evenly among sovereign losses, losses from impaired loans, and from higher funding costs. For the European banking system (BIS) overall, losses could approach €290bn.

\* Core = Germany, France, Italy, UK. Periphery = Greece, Ireland, Portugal, Spain. Europe = as defined by the 16 European countries reporting to BIS.

French banks appear to be c.16% undervalued

**We believe that the market is overly bearish on the Core banking systems** (Figure 16). At 7% stressed common equity Tier 1 ratio French banks appear to us to be c.16% undervalued. The German and Italian banks are undervalued by 15% and 5%, respectively. And the UK banks are undervalued by 13%. The German, Italian and UK banks face sets of issues on their own: restructuring, proximity to peripheral risk and an activist regulator, respectively. On the other hand, we believe that the French banks would be major beneficiaries of the upcoming G-SIFI rules and the EU's implementation of Basel 3 rules via CRD4/Maximum Harmonisation. In addition, French retail is one of the very few growth areas in Europe in the short- to medium-term.

Figure 16 illustrates our calculations in estimating under- and over-valuation. The idea behind the calculations is that the market is currently pricing in losses from sovereign exposures which partly offset any surplus above a "stressed equity Tier 1 ratio". Market participants we have spoken to often allude to 7% as being a minimum level of capitalization they would like the banks to have in a stress scenario.

## Top-Down: Sovereign Debt Losses

We use BIS and Central Banks data to calculate sovereign debt losses under a stress scenario. Our sovereign risk stress assumptions are consistent with our bottom-up stress assumptions and are in-line with the stress assumptions under EBA's 2011 stress test. **Our stress assumptions for sovereign bond prices are: 40% for Greece, 61% for Ireland, 67% for Portugal and 82% for Spain.**

**As discussed previously, these are by no means the worst-case assumptions, which could well be much greater if contagion spreads to Spain. EBA sovereign stress assumptions may still be considered optimistic by some investors; in no way do we use them to define the upper bound of losses.**

Figure 18. Top-Down Stress Test – Sovereign Debt Stress Parameters

| 5-yr Bond prices -- AFS | Stressed Prices | end-4Q10 | end-1Q11 | 15-Jun-11 | Stressed Prices vs. 15-Jun-11, ppt |
|-------------------------|-----------------|----------|----------|-----------|------------------------------------|
| Greece                  | 40%             | 74%      | 70%      | 50%       | -20%                               |
| Ireland                 | 61%             | 86%      | 76%      | 73%       | -16%                               |
| Portugal                | 67%             | 90%      | 87%      | 80%       | -16%                               |
| Spain                   | 82%             | 93%      | 95%      | 94%       | -12%                               |

The charts below show historical evolution of sovereign debt prices. Except for Spain, the three peripheral bond prices are hitting lows for recent decades. And even Spain is not too far from the lows of the early 1990s.

Figure 19. Spain – 5yr Sov Bond, 1991-2011

Figure 20. Ireland – 5yr Sov Bond, 1999-2011

Figure 22. Greece – 5yr Sov Bond, 1998-2011

Source: Reuters for all charts

Our stress test on the above assumptions leads to a €90bn estimate of losses at the European level, of which €57bn is due to losses on Greek, Irish and Portuguese debt while €33bn is on Spanish debt

Our stress test on the above assumptions leads to a €90bn estimate of losses at the European level, of which €57bn is due to losses on Greek, Irish and Portuguese debt while €33bn is on Spanish debt. Of the eight banking systems we consider individually, the Greek system is most affected with losses wiping out 57% of 4Q10 capital & reserves. The Portuguese banking system is second most-affected with 14% impact to equity and the Spanish system is third with a 10% hit. German banks are relatively less affected with 2.4% impact while the French would have a 1.6%.

A note on the accounting is due at this point. If the above losses were on a mark-to-market basis, the hit would be to book value only (through Other Comprehensive Income). However, if there ever were an “impairment trigger” as defined under IFRS rules, the impairment would need to be taken through the P&L into retained earnings and would therefore also impact the calculation of regulatory capital. For a detailed discussion on the accounting treatment for restructuring sovereign debt, please see [The Standards: Sovereign Debt Questions - Accounting for Government Debt Restructuring or Rescheduling](#).

Source: BIS, central banks, ECB, CIRA \* Data as of end-4Q10

We estimate the market is pricing in a non-trivial probability of a “credit event” for both Ireland and Portugal two- to three-years from now. Ireland’s 3-yr yield at 14% is the highest along the Irish sovereign yield curve. Similarly, for Portugal, the 3-yr yield of 13% is the highest. As for Greece, the 3-yr yield is approaching 30%, a record high since the founding of the euro area.

Figure 24. Peripheral Sovereign Yield Curves, 15 June 2011 (in ppt) \*

## Top-Down: Asset Quality Risks

During a sovereign crisis, declines in (the rate of growth of) consumption, trade and investment generally leads to lower GDP growth rates and a higher unemployment rate. Asset quality subsequently deteriorates. As Figure 25 shows, the NPL ratio in Ireland is approaching 13% while in Greece it is inching towards 11%. The underlying NPL ratios may be higher as certain restructured or flexible terms loans do not formally fall into the NPL category.

Figure 25. Peripheral Banking Systems – Asset Quality Stats, Latest Reported (2H10 or 1Q11)

|              | NPL Ratio % | Coverage Ratio % | Provisions / Loans | Loans €bn    | NPL Volumes €bn | Cumulated Provisions €bn |

Analysis by the IMF has shown that during previous banking crises or sovereign defaults the NPL ratio has peaked, on average, at 34%. The range is rather wide, at 4% (1988, US banking crisis) to 90% (1992, Sao Tome sovereign default).

Analysis by the IMF has shown that during previous banking crises or sovereign defaults the NPL ratio has peaked, on average, at 34%. The range is rather wide, at 4% (1988, US banking crisis) to 90% (1992, Sao Tome sovereign default).

Figure 26. Peak NPL Ratios Following Banking Crisis or Sovereign Default \*

Source: IMF \* Based on local methodologies

For the four peripheral countries, the combined stressed NPL ratio increases from 6.9% to 13.0%

Our stress test assumptions for asset quality assume a meaningful increase in the NPL ratios (Figure 27). **For the four peripheral countries, the combined NPL ratio increases from 6.9% to 13.0%.** We calculate the additional losses on loans at existing coverage ratios (68% combined for the four countries) to arrive at an additional cumulative provision to the loan book of 3.8%, on top of the 4.5% already provided for.

Figure 27. Peripheral Banking Systems – Asset Quality Stress Assumptions

| Country          | Current NPL Ratio | Stressed NPL Ratio | Add'l Losses % Loans * |

We estimate the stress-test scenario for peripheral loan losses is c.€100bn (3.4% of capital & reserves), of which €13bn are the true cross-border losses of Germany, France, Italy and the UK

We estimate the stress test scenario loss for peripheral loan losses at c.€100bn (3.4% of capital & reserves), of which €13bn are the true cross-border losses of Germany, France, Italy and the UK (Figure 28). The rest are losses sustained by domestic peripheral banks from domestic loan losses (Spain €45bn, Portugal €16bn, Greece €13bn, Ireland €10bn). Among the 'core' European countries, Germany's losses would be highest as % of capital & reserves – albeit at only 1.1%.

## Top-Down: Higher Funding Costs

One of the immediate effects of contagion is higher funding costs for the banks. In previous episodes of the sovereign crisis, interbank secured and unsecured rates shot up meaningfully as did sovereign and senior unsecured spreads across the Euro Area. In addition, availability of funding also became an issue as markets were unwilling to lend money even at a substantially higher cost.

**We stress test new required funding for the EU27 banks along these two dimensions: cost and availability; our time horizon is 1 year**

We stress test *new required funding* for the EU27 banks along these two dimensions: cost and availability. Our time horizon is 1 year. The analysis involves estimating the “funding balance sheet” of the EU27 banking system from a number of sources as well as the average maturity of each source (in order to estimate the annual rollover rate). We then estimate the existing cost for each type of funding: customer deposits, MFI deposits, interbank, commercial paper, senior secured (such as covered bonds), senior unsecured and hybrids/preferreds.

■ Our **cost stresses on new funding** are calibrated to stress episodes in the past, but especially the Lehman (Sept-Oct 2008) and original Greek (April 2010) crisis episodes. For example, we assume that banks scramble to collect deposits whose cost would increase by 75 bps to 3.25% over the year. For term funding, we believe a cost increase of 225 bps, to 6.0%, would not be unrealistic. In the aggregate, the average funding cost rises from 2.03% to a “stressed” level of 3.36%, a 133 bps increase.

■ The **availability stresses on new funding** assume that interbank and wholesale funding dries up. For example, we believe that a 25% reduction in MFI deposits, interbank lending and term funding would not be unrealistic in a sovereign crisis worst-case scenario. In addition, we believe banks would delever up to 10% of the existing balance sheet over a 1-year period should the stress-test sovereign scenario last for that long.

But most importantly, we believe that the ECB would have to meet the resulting c.€700bn gap in funding. Such an increase would bring the total of ECB funding to €1.2tn – a third more than the peak amount provided by the ECB in the past.

The net result of our stress test is an increase in systemwide funding costs of €174bn pre-tax, a 25% increase on existing costs over a 1-year period (Figure 29).

Figure 29. EU27 Banks – Top-Down Stress Test on Funding Costs with a 1-year Time Horizon

The net impact on the bottom-line would be €100bn, or 65 bps on existing system loans and 63% of 2009A net disposable income for the EU27 banking sector

To arrive at an estimate of net impact, we give credit to the banks for repricing through higher benchmarks or higher SVRs as well as for a 25% tax shield. We assume that the full amount of the increase in costs (133 bps) could be passed on to a quarter of existing loans. **The net impact on the bottom-line would be €100bn, or 65 bps on existing system loans and 63% of 2009A net disposable income for the EU27 banking sector.**

Source: Citi Investment Research and Analysis \* Assumptions: the average loan maturity is 5 years. Overall increase in funding costs is fully passed on to 1/4 of loans through higher benchmark rates or a bank's own Standard Variable Rate. Of the assumed €3.4tn delevering, 50% relates to loans and 50% to securities. Delevering occurs in mid-year. 50% of maturing loans do not renew.

Lastly, we allocate funding costs to specific countries using % Total Assets as a starting point. We then adjust the share of the additional higher funding costs calculated above by taking into account the quality of the loan books held by the non-covered and non-quoted banking sectors (Figure 31).

## How Contagious Are the Peripheral Sovereigns

Even within the four peripheral countries (Portugal, Ireland, Greece and Spain) analysts and investors should differentiate between those that could be more and those that could be less infectious to the wider European banking system. We believe that the potential contagion risk is based on four important factors:

**We believe that the potential contagion risk is based on four important factors**

- The initial 'state' of sovereign indebtedness and the forecast path toward stability during the 2010-15 period (including austerity measures);
- For the bailed out peripherals, how aggressive are the assumptions for return to the capital markets;
- The interconnectedness between the peripheral country and the wider European banking system (see earlier section on Interconnectedness); and
- Potential losses from restructuring of sovereign debt to the non-bank sector.

### Current and Forecast Fiscal Stability

**Greece is in a difficult fiscal situation**

**Our economists believe that there is a high likelihood of debt restructuring with haircuts in Greece, Ireland and Portugal – compared to which EBA's sovereign stress test parameters appear benign.**

With a Debt/GDP ratio of 142% in 2010, and a forecast of 191% in 2015, **Greece** is in a difficult fiscal situation. Our economists expect the fiscal balance as % of GDP to improve from -10.5% in 2010 to -7.5% in 2015. At that point, Greece will still have the highest budget deficit of all peripherals, followed by Ireland at -5.4%. They estimate Greek GDP growth will only return in 2014 and will reach a rather anemic 1.0% in 2015 (Figure 32). The one bright spot for Greece is inflation over the period 2010-15, which we forecast will be the highest among the four peripherals, at an average of 2.4% (Figure 33). Higher inflation chips away at existing debt – but probably hampers export competitiveness and domestic consumption.

**Ireland is expected by the IMF to record the best improvement in its fiscal balance**

For **Ireland**, the IMF – in a probably somewhat optimistic outlook – estimates GDP growth should increase from -1.0% in 2010 to 3.3% in 2015 and the current account should be slightly positive from 2011 onwards – both driven by increasing exports from the open Irish economy which is likely to regain competitiveness over time. In addition, Ireland is expected by the IMF to record the best improvement in its fiscal balance as % of GDP – of c.8pp over 2010-15.

**Portugal will muddle through the next five years with an average GDP decline**

Our economists also estimate **Portugal** will record an average GDP decline of -0.3% over the next five years, with growth turning positive only in 2014 (0.6%). Government Debt/GDP will likely increase from 93% in 2010 to 124% in 2015E, below Greece's (191%), in-line with Italy's (124%) and Ireland's (123%) – but much above Spain's (82%, Figure 34), on our estimates. On the positive side of things, Portugal will likely record a large improvement in the fiscal balance from a deficit of 9.1% of GDP in 2010 to an expected deficit of 5.1% in 2015.

**Spain is slowly tackling the problems of its banking sector**

**Spain** is slowly tackling the problems of its banking sector. Even though reforms have accelerated since the beginning of the year, investors are still concerned about the recognition of losses in the real estate loans of the caja sector. However, in 2015, our economists expect that Spain will have a budget deficit of 'only' -3.9% of GDP, the lowest among the four peripherals (Figure 35). The country's Debt/GDP will also be the lowest, at 82% in 2015 on Citi economists' estimates and below the psychologically important mark of 90% - the level beyond which economists Reinhart & Rogoff believe growth starts suffering.

According to our economists, Greece and Ireland are the most advanced in their announcement and planning of austerity measures – which is probably a function of how critical the crisis has been in these two countries (Figure 37). Unfortunately, even Greece's frenetic pace of legislating may not be able to help growth prospects in the short-term.

## Return to the Capital Markets

### Greece: IMF/EU's Aggressive Assumptions

Earlier this year, the EU and IMF came to realise that Greece would not be able to return to the capital markets in 2012, as originally planned, due to a deteriorating fiscal position and lack of GDP growth in the near-term. Under the assumptions of the original bailout package, Greece would have tapped the capital markets for €32bn in 2012 and €40bn in 2013 (see Figure 39 and [Euro Weekly - Negotiation Time](#)). Now, this money will have to be funded by further austerity measures, privatisation proceeds, the IMF/EU and, if Germany's proposal goes ahead, by private bondholders. To complicate matters further, the IMF has insisted on specific funding plans for Greece through the following 12 months as a pre-condition of disbursing the fifth tranche of the original bailout package.

Source: Citi Investment Research and Analysis \* Assuming €0 private debtholder participation

Various options have been proposed to deal with Greece's debts, with two gaining particular traction: a voluntary rollover of maturing debt and a wholesale extension of all debt by 7 years

The Greek government responded with proposals for a new package of austerity measures which it forecasts will shrink the deficit to -1.1% in 2015 vs. -14.4% under a "baseline" scenario of no policy change. The point of contention has been around how to involve the private debtholders. Various options have been proposed, with two gaining particular traction: a voluntary rollover of maturing debt and a wholesale extension of all debt by 7 years.

The former proposal is favoured by the ECB as it is perceived as not triggering a "selective default" by the rating agencies or a "credit event" under the definitions of the ISDA Determinations Committee (which regulates the CDS market; see [Sovereign rescheduling: what triggers CDS? - Scylla, Charybdis and the lure of the lotus eaters](#)). To put the proposal in perspective, the funding shortfall amounts to €72bn over 2011-13. In order to make a par-for-par rollover, the coupon on the new bonds will have to be 18% (assuming 7-year new bonds). At that coupon rate, Greece's Debt/GDP would grow by an additional 4 ppt every year due to the higher coupon alone. So a lower coupon with other sweeteners may be needed, in the form of preferred creditor status for the new bonds which, in its turn, runs the risk of triggering selective default due to negative pledges on existing debt.

The latter proposal involving a wholesale extension of maturity is favoured by Germany as a form of burden sharing by the private debtholders but is also more likely to cause a selective default for the rating agencies. Germany's taxpayers are experiencing a case of bailout fatigue – while Chancellor Merkel is unlikely to gain any popularity as more bailout money is spent in future.

The inability of the EU to agree on a favoured approach has made the market extremely nervous. Greek 2-year government yields are approaching 30% and Greece itself has, in the meantime, been downgraded to CCC by S&P and Caa by Moody's – the world's lowest sovereign credit rating.

\* Core Europe = Germany, France, Italy, UK.

\*\* Data is on domestic-to-domestic exposures. "Other Eur" column contains cross-border data for Greece, Ireland and Portugal.

\*\*\* Europe defined as BIS reporting banks/countries (Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom).

# Appendix: 2011 EBA European Bank Stress Tests

## Capital Definition

- Definition of capital with EBA is more stringent
  - 5% core Tier 1 ratio under Basel 2/2.5 – vs. 6% Tier 1 last year
  - Based on existing EU legislation in the Capital Requirements Directive (CRD)
  - Takes the existing EU definition of Tier 1 net of deductions of participations in financial institutions and it strips out hybrid instruments including existing preference shares
  - Recognises existing government support measures, which will be identified separately in the results – question mark over German silent participations
  - Only commercial instruments of the highest quality are included in this CT1 definition – ordinary shares or similar instruments in line with the principles detailed in CEBS/EBA guidelines on core capital
- No sovereign haircuts in the banking book (just as last year)
- Stress test along the following variables: GDP growth, HCIP/CPI inflation, unemployment rate, interest rates & stock prices
- Similar methodological approach to last year's stress tests

## Economics & Markets

- **Baseline Scenario: Economics**

Parameters are less harsh than last year's as the macro situation has improved since then. GDP + 1.7% in 2010-11 and c2% in 2012 (1.5% and 1.8% for Euro Area countries). The unemployment rate is projected to fall to around 9% in 2012 (against 9.5% in 2011), and the public deficit will gradually decline to 5% of GDP in 2011 and about 4¼% in 2012.
- **Baseline Scenario: Markets**

Short-term interest rates in euro area are expected to increase gradually to 1.5% and 1.8% in 2011 and 2012 in the euro area. Long-term interest rates for the same region are assumed to be 2.5% in 2010, 2.7% in 2011 and 2.9% in 2012. The dollar is expected to depreciate against Euro from 1.33 in 2010 to 1.39 in 2011 and 2012.
- **Adverse Scenario: Economics**

Again, these are less adverse than last year's assumptions. The adverse scenario this year combines a set of EU shocks, a global negative demand shock originating in the US and a USD depreciation vis-à-vis all currencies. The cumulative decline of GDP over two years is now assumed to be 3% off the baseline growth compared to 4% in last year's stress test.
- **Adverse Scenario: Markets**

Equity market falls of -10% to -20% (Euro Area -15%). Yields on German 10-year bonds are assumed to remain at the baseline level, while, on average, euro area long-term interest rates go up by 75 basis points, and by 66 basis points in the EU. Money market rates increase by c125 bps. Funding costs increase in line with higher interest rates and higher credit spreads and banks are assumed to be able to pass on only 50% of the increase to customers.

Source: EBA

## Sovereign Marks

- This year EBA has decided to apply a curve of haircuts to the banking book depending on maturity– rather than a single haircut as last year
- Belgium, France, Ireland, Italy, Portugal and Spain exposures look likely to be stressed more compared to 2011

## Appendix A-1

### Analyst Certification

The research analyst(s) primarily responsible for the preparation and content of this research report are named in bold text in the author block at the front of the product except for those sections where an analyst's name appears in bold alongside content which is attributable to that analyst. Each of these analyst(s) certify, with respect to the section(s) of the report for which they are responsible, that the views expressed therein accurately reflect their personal views about each issuer and security referenced and were prepared in an independent manner, including with respect to Citigroup Global Markets Inc and its affiliates. No part of the research analyst's compensation was, is, or will be, directly or indirectly, related to the specific recommendation(s) or view(s) expressed by that research analyst in this report.

#### Guide to Citi Investment Research & Analysis (CIRA) Fundamental Research Investment Ratings:

CIRA's stock recommendations include a risk rating and an investment rating.

**Risk ratings**, which take into account both price volatility and fundamental criteria, are: Low (L), Medium (M), High (H), and Speculative (S).

**Investment ratings** are a function of CIRA's expectation of total return (forecast price appreciation and dividend yield within the next 12 months) and risk rating.

Analysts may place covered stocks "Under Review" in response to exceptional circumstances (e.g. lack of information critical to the analyst's thesis) affecting the company and/or trading in the company's securities (e.g. trading suspension). Stocks placed "Under Review" will be monitored daily by management. As soon as practically possible, the analyst will publish a note re-establishing a rating and investment thesis.

To satisfy regulatory requirements, we correspond Under Review to Hold in our ratings distribution table for our 12-month fundamental rating system. However, we reiterate that we do not consider Under Review to be a recommendation.

**Relative three-month ratings:** CIRA may also assign a three-month relative call (or rating) to a stock to highlight expected out-performance (most preferred) or under-performance (least preferred) versus the analyst's coverage universe over a 3 month period. The relative call may highlight a specific near-term catalyst or event impacting the company or the market that is anticipated to have a short-term price impact on the equity securities of the company. Absent any specific catalyst the analyst(s) will indicate the most and least preferred stocks in his coverage universe, explaining the basis for this short-term view. This three-month view may be different from and does not affect a stock's fundamental equity rating, which reflects a longer-term total absolute return expectation. For purposes of NASD/NYSE ratings-distribution-disclosure rules, most preferred calls correspond to a buy recommendation and least preferred calls correspond to a sell recommendation. Any stock not assigned to a most preferred or least preferred call is considered non-relative-rated (NRR). For purposes of NASD/NYSE ratings-distribution-disclosure rules we correspond NRR to Hold in our ratings distribution table for our 3-month relative rating system. However, we reiterate that we do not consider NRR to be a recommendation.

For securities in developed markets (US, UK, Europe, Japan, and Australia/New Zealand), investment ratings are: Buy (1) (expected total return of 10% or more for Low-Risk stocks, 15% or more for Medium-Risk stocks, 20% or more for High-Risk stocks, and 35% or more for Speculative stocks); Hold (2) (0%-10% for Low-Risk stocks, 0%-15% for Medium-Risk stocks, 0%-20% for High-Risk stocks, and 0%-35% for Speculative stocks); and Sell (3) (negative total return).

For securities in emerging markets (Asia Pacific, Emerging Europe/Middle East/Africa, and Latin America), investment ratings are: Buy (1) (expected total return of 15% or more for Low-Risk stocks, 20% or more for Medium-Risk stocks, 30% or more for High-Risk stocks, and 40% or more for Speculative stocks); Hold (2) (5%-15% for Low-Risk stocks, 10%-20% for Medium-Risk stocks, 15%-30% for High-Risk stocks, and 20%-40% for Speculative stocks); and Sell (3) (5% or less for Low-Risk stocks, 10% or less for Medium-Risk stocks, 15% or less for High-Risk stocks, and 20% or less for Speculative stocks).

Investment ratings are determined by the ranges described above at the time of initiation of coverage, a change in investment and/or risk rating, or a change in target price (subject to limited management discretion). At other times, the expected total returns may fall outside of these ranges because of market price movements and/or other short-term volatility or trading patterns. Such interim deviations from specified ranges will be permitted but will become subject to review by Research Management. Your decision to buy or sell a security should be based upon your personal investment objectives and should be made only after evaluating the stock's expected performance and risk.

#### NON-US RESEARCH ANALYST DISCLOSURES

Non-US research analysts who have prepared this report (i.e., all research analysts listed below other than those identified as employed by Citigroup Global Markets Inc.) are not registered/qualified as research analysts with FINRA. Such research analysts may not be associated persons of the member organization and therefore may not be subject to the NYSE Rule 472 and NASD Rule 2711 restrictions on communications with a subject company, public appearances and trading securities held by a research analyst account. The legal entities employing the authors of this report are listed below:

#### OTHER DISCLOSURES

Citigroup Global Markets Inc. and/or its affiliates has a significant financial interest in relation to Banco Popolare, Barclays PLC, Banco Bilbao Vizcaya Argentaria SA, Komerční Banka as, Bankinter SA, Banca Monte dei Paschi di Siena SpA, BNP Paribas SA, Credit Agricole SA, Commerzbank, Natixis, UniCredit Group, Credit Suisse, Danske Bank A/S, Deutsche Bank, Dexia, DNB NOR ASA, Garanti Bank, HSBC Holdings PLC, ING Groep NV, Intesa Sanpaolo, Lloyds Banking Group PLC, Nordea, OTP Bank Plc, Banca Popolare di Milano, Banco Popular Espanol, Raiffeisen Bank Intl, Royal Bank of Scotland Group PLC, Banco de Sabadell SA, Banco Santander, Skandinaviska Enskilda Banken AB, Svenska Handelsbanken AB, Societe Generale, Swedbank AB, Unione Banche Italiane, Yapi Kredi Bank. (For an explanation of the determination of significant financial interest, please refer to the policy for managing conflicts of interest which can be found at [www.citigroupgeo.com](http://www.citigroupgeo.com).)

Citigroup Global Markets Inc. or its affiliates beneficially owns 2% or more of any class of common equity securities of Commerzbank, Deutsche Bank.

Citigroup Global Markets Inc. or its affiliates beneficially owns 10% or more of any class of common equity securities of Barclays PLC.

For securities recommended in the Product in which the Firm is not a market maker, the Firm is a liquidity provider in the issuers' financial instruments and may act as principal in connection with such transactions. The Firm is a regular issuer of traded financial instruments linked to securities that may have been recommended in the Product. The Firm regularly trades in the securities of the issuer(s) discussed in the Product. The Firm may engage in securities transactions in a manner inconsistent with the Product and, with respect to securities covered by the Product, will buy or sell from customers on a principal basis.

Citigroup Global Markets Inc. or its affiliates acts as a corporate broker to Lloyds Banking Group PLC.

Securities recommended, offered, or sold by the Firm: (i) are not insured by the Federal Deposit Insurance Corporation; (ii) are not deposits or other obligations of any insured depository institution (including Citibank); and (iii) are subject to investment risks, including the possible loss of the principal

amount invested. Although information has been obtained from and is based upon sources that the Firm believes to be reliable, we do not guarantee its accuracy and it may be incomplete and condensed. Note, however, that the Firm has taken all reasonable steps to determine the accuracy and completeness of the disclosures made in the Important Disclosures section of the Product. The Firm's research department has received assistance from the subject company(ies) referred to in this Product including, but not limited to, discussions with management of the subject company(ies). Firm policy prohibits research analysts from sending draft research to subject companies. However, it should be presumed that the author of the Product has had discussions with the subject company to ensure factual accuracy prior to publication. All opinions, projections and estimates constitute the judgment of the author as of the date of the Product and these, plus any other information contained in the Product, are subject to change without notice. Prices and availability of financial instruments also are subject to change without notice. Notwithstanding other departments within the Firm advising the companies discussed in this Product, information obtained in such role is not used in the preparation of the Product. Although Citi Investment Research & Analysis (CIRA) does not set a predetermined frequency for publication, if the Product is a fundamental research report, it is the intention of CIRA to provide research coverage of the/those issuer(s) mentioned therein, including in response to news affecting this issuer, subject to applicable quiet periods and capacity constraints. The Product is for informational purposes only and is not intended as an offer or solicitation for the purchase or sale of a security. Any decision to purchase securities mentioned in the Product must take into account existing public information on such security or any registered prospectus.

---

Investing in non-U.S. securities, including ADRs, may entail certain risks. The securities of non-U.S. issuers may not be registered with, nor be subject to the reporting requirements of the U.S. Securities and Exchange Commission. There may be limited information available on foreign securities. Foreign companies are generally not subject to uniform audit and reporting standards, practices and requirements comparable to those in the U.S. Securities of some foreign companies may be less liquid and their prices more volatile than securities of comparable U.S. companies. In addition, exchange rate movements may have an adverse effect on the value of an investment in a foreign stock and its corresponding dividend payment for U.S. investors. Net dividends to ADR investors are estimated, using withholding tax rates conventions, deemed accurate, but investors are urged to consult their tax advisor for exact dividend computations. Investors who have received the Product from the Firm may be prohibited in certain states or other jurisdictions from purchasing securities mentioned in the Product from the Firm. Please ask your Financial Consultant for additional details. Citigroup Global Markets Inc. takes responsibility for the Product in the United States. Any orders by US investors resulting from the information contained in the Product may be placed only through Citigroup Global Markets Inc.

Unless specified to the contrary, within EU Member States, the Product is made available by Citigroup Global Markets Limited, which is regulated by Financial Services Authority.

Pursuant to Comissão de Valores Mobiliários Rule 483, Citi is required to disclose whether a Citi related company or business has a commercial relationship with the subject company. Considering that Citi operates multiple businesses in more than 100 countries around the world, it is likely that Citi has a commercial relationship with the subject company.

Many European regulators require that a firm must establish, implement and make available a policy for managing conflicts of interest arising as a result of publication or distribution of investment research. The policy applicable to CIRA's Products can be found at [www.citigroupgeo.com](http://www.citigroupgeo.com).

Compensation of equity research analysts is determined by equity research management and Citigroup's senior management and is not linked to specific transactions or recommendations.

The Product may have been distributed simultaneously, in multiple formats, to the Firm's worldwide institutional and retail customers. The Product is not to be construed as providing investment services in any jurisdiction where the provision of such services would not be permitted.

Subject to the nature and contents of the Product, the investments described therein are subject to fluctuations in price and/or value and investors may get back less than originally invested. Certain high-volatility investments can be subject to sudden and large falls in value that could equal or exceed the amount invested. Certain investments contained in the Product may have tax implications for private customers whereby levels and basis of taxation may be subject to change. If in doubt, investors should seek advice from a tax adviser. The Product does not purport to identify the nature of the specific market or other

risks associated with a particular transaction. Advice in the Product is general and should not be construed as personal advice given it has been prepared without taking account of the objectives, financial situation or needs of any particular investor. Accordingly, investors should, before acting on the advice, consider the appropriateness of the advice, having regard to their objectives, financial situation and needs. Prior to acquiring any financial product, it is the client's responsibility to obtain the relevant offer document for the product and consider it before making a decision as to whether to purchase the product. CIRA concurrently disseminates its research via proprietary and non-proprietary electronic distribution platforms. Periodically, individual analysts may also opt to circulate research to one or more clients by email. Such email distribution is discretionary and is done only after the research has been disseminated via the aforementioned distribution channels.
